Town of Cary
Water Shortage Response Plan

Prepared by: Sarah Braman, P.E., Water Resources Engineer and Marie Cefalo, Water Resources Outreach Supervisor
Supersedes: 8/13/2015
Adopted by Council: 6/25/2020
Effective: 6/25/2020

Purpose: To establish measures and procedures for reducing potable water use during times of water shortage. This plan does not apply to reclaimed water use.

0. Background
In 1996 Cary established a comprehensive water conservation program designed to effectively manage our long-term water resources. The established goals for the program are to support the high quality of life in Cary by providing safe, reliable water service, while reducing per capita use of potable water, conserve a limited natural resource, and reduce the costs of infrastructure expansion.

To achieve these goals the comprehensive water conservation program includes regulatory, educational, and financial incentive components.

- The regulatory component primarily consists of three year-round water conservation ordinances: Section 36-80, Water Service Provided by Town Includes only Alternate Day Outdoor Irrigation; Section 36-83, Waste While Watering Ordinance; Section 36-84 Rain Sensor Ordinance. There are also irrigation system design requirements included in the Land Development Ordinance.

- The fundamental educational initiatives are administered through the Town’s webpages, monthly utility newsletter, and social media posts.

- The primary financial incentive is the Town’s tiered rate structure.

In contrast to Cary’s long-term water conservation program, the purpose of this Water Shortage Response Plan (WSRP) is to deal with short-term or immediate water shortage, which may be caused by things such as drought, water quality problems, or disruptions in facility operations. Cary has been required by the state to have a WSRP since 2001 by both our Jordan Lake Allocation water supply contract and our 2001 interbasin transfer (IBT) certificate. The 2015 IBT certificate requires Cary and Apex to have a Drought Management Plan as well. Since July 1, 2009, all public and privately owned water systems subject to GS 143-355 (l) are required to have an approved WSRP as part of their Local Water Supply Plans (LWSP). Rules governing water use during droughts and water emergencies (15A NCAC 02E. 0607) stipulate specific items that must be included in those plans. This WSRP was developed in accordance with the Water Shortage Response Plan Guidelines provided by the Division of Water Resources (January 2009) and supports the Drought Management Plan required by our 2015 IBT certificate.
I. Authorization

The Cary Town Manager, and in his or her absence the Deputy or an Assistant Town Manager, is authorized by Section 36-81 of the Town Code of Ordinances to declare a Water Shortage and to enact water shortage response provisions. References in this document to the Town Manager apply to the Deputy or Assistant Town Managers in the Town Manager’s absence.

II. Notification

Once a Water Shortage has been declared, and whenever the Water Shortage Response Stage (defined in Section IV below) changes, the following notifications will be made:

1. A notice of the effective date of the declaration and the current water use reduction stage will be posted at Town Hall and other town facility monitors.

2. The Town Manager (or designee) notifies the Mayor, Town Council, neighboring municipal contract water recipients, and town department managers.

3. The Marketing Director (or designee) will develop a media release and share with the media. The media, using television, print, internet, social media, and radio, will inform the public. The media release will include contact information for Cary’s central customer center (311 center) to provide additional information needed by the public.

4. The Marketing Director (or designee) will update Cary’s website and social media accounts with the Water Shortage status.

5. The Utilities Director (or designee) will provide a summary of the situation and communication tactics to the 311 center, 911 police communications, the Water Distribution System Operator, and the general Cary employees via email and/or Salesforce Chatter platform so they can help provide accurate information to the public.

6. The Utilities Director (or designee) will contact critical water customers (both irrigation and water accounts) and inform them of the implemented measures.

7. The 311 center will coordinate with bulk users and inform them of implemented measures.

8. The Utilities Director (or designee) will directly notify both residential and non-residential customers of water restrictions via mail and/or e-mail when a water shortage is declared and when a new more restrictive stage is implemented.

9. The Utilities Director (or designee) will provide Public Works field employees with handouts to give customers who ask them questions as they work throughout the community.

During drought periods when declaration of a water shortage appears likely, Cary will keep customers informed of the potential for declaring a water shortage, and will provide information to customers via media releases, Cary’s website and social media.
about measures they can take to reduce water use and, potentially, avoid a water shortage situation.

III. Drought Contingency Plans for Non-residential Customers

Non-residential customers, particularly those who use relatively large amounts of potable water and/or use potable water for public health purposes (e.g., hospitals or assisted living facilities), are encouraged to develop a Drought Contingency Plan well in advance of a potential water shortage situation. This can be accomplished by developing a Drought Contingency Plan during normal water supply conditions before there is a water shortage situation. The plan should determine the measures they would implement to satisfy the requirements of the Water Shortage Response stages described in Section IV.

If, after developing a Drought Contingency Plan, a customer believes that meeting the default water use reduction requirements will compromise public health and safety or cause extreme hardship, the customer can submit a Drought Contingency Plan as described below to the Utilities Director (or designee) for consideration and approval. An approved Drought Contingency Plan can then be used – and must be followed – in lieu of meeting the default requirements included in Section IV for non-residential customers.

To be considered for approval a Drought Contingency Plan must include:

1. Estimated amount of potable water use per day, during both an average winter month and an average summer month, for different purposes including drinking water, basic sanitation, process water, irrigation, and other major uses specific to the customer

2. Description of any alternate water sources available

3. Description of existing high-efficiency fixtures, technologies, hardware, management practices, or other measures in use to reduce water use.

4. Measures that would be taken during each Water Shortage Response stage in order to satisfy the requirements in Section IV.

5. Description of the impact to the customer or to the public (e.g. reduced production, reduction of business hours, employee impacts, structural damage, etc.) of meeting the water use reduction requirements.

6. Proposed alternative measures to be taken during each Water Shortage Response stage, and the resulting expected reduction in water use for the categories listed in item 1, under both average winter and average summer conditions.

Non-residential customers with an approved Drought Contingency Plan must resubmit their plan for approval every five years, or sooner if there is a significant change in water use or other conditions which would alter the plan’s effectiveness.
IV. Water Shortage Response Stages

Four water shortage response stages, intended to achieve system-wide water use reduction, are described below, and summarized in Table 1 compared with Cary’s year-round alternate day watering ordinance. These stages only apply to potable water and do not affect reclaimed water use.

Public communications outlined in Section II will include information about how customers can access their historical water use through the customer Web portal. Communications will also include information on how much water can be saved with different water use reduction measures.

Non-residential customers who have an approved Drought Contingency Plan must reduce water use during each stage as specified in their plans.

Stage 1

Spray irrigation (from above and in ground systems) using potable water is limited to one (1) day per week for all purposes except the maintenance of athletic fields. No new turf watering exemption permits will be issued and any existing permits for watering periods that begin later than 14 days after the effective date of Stage 1 will be rescinded. Hand watering, drip irrigation, and subsurface irrigation are still allowed any day of the week. Other outdoor water uses such as pressure washing, car washing, and keeping swimming pools filled are allowed, although customers are strongly encouraged to minimize such uses.

Stage 2

Spray irrigation (from above and in ground systems) using potable water is not allowed for any purpose except the maintenance of athletic fields. No new turf watering exemption permits will be issued, and any previously issued exemption permits for watering periods that have not expired will be rescinded. Hand watering, drip irrigation, and subsurface irrigation are still allowed. Other outdoor water uses such as pressure washing, car washing, and keeping swimming pools filled are allowed, although customers are strongly encouraged to minimize such uses.

Stage 3

No outdoor water use with potable water is allowed, including but not limited to: spray irrigation (from above and in ground systems), hand watering, drip irrigation, and subsurface irrigation, ornamental fountains, spraygrounds, car washing, pressure washing, and keeping swimming pools filled. No new turf watering exemption permits will be issued and any previously issued permits for watering periods that have not expired will be rescinded. Firefighting and utility system maintenance are the only allowable outdoor water uses.

All customers are required to limit their monthly water use to average winter monthly use, as defined by December, January and February usage. This amount is provided on the customer Web portal. Customers may also contact the 311 center for assistance. Customers will be asked to determine their winter average well in advance of Stage 3 implementation. If historical monthly use was radically different than expected normal winter indoor use (e.g., a customer was away for an extended period) staff may modify
the monthly limit. The approach will be the same for residential and non-residential customers.

Rationing

In this stage, the goal is to ensure there is drinking water available to protect public health (e.g., health care, drinking water, basic sanitation). Customers are encouraged to use the minimum amount of water needed for public health protection. No outdoor water use with potable water is allowed, including but not limited to: spray irrigation (from above and in ground systems), hand watering, drip irrigation, and subsurface irrigation, ornamental fountains, spraygrounds, car washing, pressure washing, and keeping swimming pools filled. As in Stage 3, no new turf watering exemption permits will be issued and any previously issued permits for watering periods that have not expired will be rescinded. Firefighting and utility system maintenance are the only allowable outdoor water uses.

All customers are required to reduce their normal winter water use, as defined above in Stage 3, by 15%.

¹ Non-residential customers with an approved Drought Contingency Plan will follow the steps in their Plans.
V. Water Shortage Response Triggers for Chronic Conditions

Triggers are conditions which, when reached, cause a water shortage response stage to be implemented. Triggers are based on the ability to meet water demands and are influenced by several components of the Town’s water supply system: the water source (Jordan Lake and/or purchase from others), raw water intake and pipeline, treatment plant, storage tanks, and distribution system. Utilities Director and designees continually evaluate the status of all these components to determine if a water shortage condition exists or is approaching. These triggers only apply to potable water and do not affect reclaimed water use.

The triggers that would initiate a water shortage declaration from the Town Manager, and cause changes in the Water Shortage Response Stages are based on the number of days of water supply available to meet potable water demands. This plan does not address reclaimed demand. The days of water supply remaining is calculated by dividing the working supply volume by the moving 30-day average daily demand. The working supply volume is defined as the amount currently stored, and accessible without permitting or capital improvements, in the combined Cary/Apex, Morrisville, and Wake County (for RTP South) Jordan Lake water supply storage allocations. The moving 30-day average daily demand is the total demand in the Towns of Apex, Cary and Morrisville, and RTP South.

\[
\text{Days of Supply Remaining} = \frac{\text{Working Supply Volume}}{\text{Moving 30-Day Average of Daily Demand}}
\]

Table 2 describes the triggers for entering the increasing stages of Water Shortage Response as conditions worsen and the Days of Supply Remaining declines. The Utilities Director (or designee) will advise the Town Manager, in writing, when a trigger has been reached for a water shortage response stage. The Manager (or designee) shall then implement the appropriate water shortage response stage by issuing a declaration to take effect within 10 days of the date when the trigger was reached. The Town Manager may, based on other factors (described below), declare a Water Shortage or implement stages before a trigger is reached (sooner than Table 2 would indicate) if Days of Supply are declining or other conditions are worsening.

Table 2: Water Shortage Response Triggers for Declining Days of Supply Remaining

<table>
<thead>
<tr>
<th>Stage</th>
<th>Triggers When Days of Supply Remaining is Declining</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Water Shortage declared)</td>
<td>Days of Supply Remaining is 120 days or less</td>
</tr>
<tr>
<td>Stage 1</td>
<td>Stage 1 has been in place for 28 continuous days AND Days of Supply Remaining is 90 days or less</td>
</tr>
<tr>
<td>Stage 1 to Stage 2</td>
<td>Days of Supply Remaining is 60 days or less</td>
</tr>
<tr>
<td>Stage 2 to Stage 3</td>
<td>Days of Supply Remaining is 30 days or less</td>
</tr>
</tbody>
</table>

Table 2
Table 3 describes the triggers for moving out of Water Shortage Response stages as conditions improve and the Days of Supply Remaining increases. The Utilities Director shall advise the Manager, in writing, when a trigger has been reached for decreasing a water shortage response stage or ending a water shortage declaration. Based on the written notification that a trigger has been reached, the Manager, in his discretion, may issue a declaration decreasing the water shortage response stage or ending a water shortage declaration. Based on other factors (described below), the Manager may elect to move out of a stage after a trigger is reached (slower than Table 3 would indicate).

**Table 3: Water Shortage Response Triggers for Increasing Days of Supply Remaining**

<table>
<thead>
<tr>
<th>Stage</th>
<th>Triggers When Days of Supply Remaining is Increasing</th>

<tbody>
<tr>
<td>Rationing to Stage 3</td>
<td>Days of Supply Remaining has been at least 60 days for at least 14 continuous days</td>
</tr>
<tr>
<td>Stage 3 to Stage 2</td>
<td>Days of Supply Remaining has been at least 90 days for at least 14 continuous days</td>
</tr>
<tr>
<td>Stage 2 to Stage 1</td>
<td>Days of Supply Remaining has been at least 120 days for at least 14 continuous days</td>
</tr>
<tr>
<td>Water Shortage ended</td>
<td>Jordan Lake Water Supply allocation has been 100% full for at least 14 continuous days</td>
</tr>
</tbody>
</table>

Other factors considered may include but not be limited to:

- Jordan Lake elevation and recent inflow
- US Army Corps of Engineers’ operation of Jordan Lake in drought contingency mode.
- Indications of short or long-term water quality concerns regarding Jordan Lake or other sources.
- Level of interbasin transfers relative to the Cary/Apex interbasin transfer certificate amount.
- Drought Advisory issued by the NC Drought Management Advisory Council.
- Sudden loss of supplemental water supplies during periods of high demand.

**VI. Water Shortage Triggers and Response for Acute Conditions**

Events such as contamination, equipment or facility failure, or line breaks require a swift and immediate response. Examples of conditions that may result in an immediate water shortage include:

- The occurrence of a major water transmission main break, fire, or any other emergency that would require high volumes of water, such that demand could exceed supply.
- Accidental or intentional contamination of the water system.
- Mechanical failure in the water treatment plant or distribution system.
- Inability to distribute water through part of the system.
The following Standard Operating Procedures identify protocols Town staff follows when these circumstances arise:

- OPS #007, De-chlorination Procedure for Water Distribution System Flushing and Main Break or Reclaimed Water System Main Break
- OPS #008, Water Main and Service Line Breaks
- OPS #010, Water Transmission Main Shut Down
- OPS #015, Water Main Break by Contractor
- OPS #017, Fecal Coliform-E.coli/Contamination Response

In addition, an Emergency Response Plan, kept confidential for security purposes, identifies detailed procedures to follow should an emergency of that magnitude happen. Upon recommendation of the Utilities Director, the Town Manager may declare a water shortage and implement any water shortage response stages or other measures as he or she deems appropriate for any such immediate water shortage situation.

**VII. Enforcement**

Compliance with the requirements of the Water Shortage Response Plan is required by the Water Shortage Ordinance (Section 36-81). Penalties are specified annually in the Budget Ordinance (Schedule of Fees and Charges). These compliance measures only apply to potable water and do not affect reclaimed water use.

Town staff will monitor customer usage and determine opportunities for education and enforcements. During or prior to a water shortage declaration, the Utilities Director will designate staff to educate and enforce both our year-round water conservation ordinances (which address outdoor water use and water waste) as well as water shortage stage requirements. During a water shortage there will be no warnings before fines are issued for non-compliance with outdoor water use restrictions, and the fines are higher than during normal times. However, the fine for a first-time violation will be deferred and either 1) waived at the end of the water shortage if there is not a second violation or 2) added to the fine for a second violation if that occurs.

Reductions in indoor water use are not required in Stages 1 and 2, but the amount of reductions that may be occurring voluntarily will be evaluated using water usage data. Compliance with the required indoor water use reductions in Stage 3 and Rationing will be monitored, and Town staff will audit water use as conditions warrant and/or if expected overall system water use is not decreasing as needed.

**VIII. Variance Protocols**

Cary recognizes that the requirements for water use reduction in Table 1 may have significantly more impact on some customers than on others and in some cases could affect public health and safety. To be considered for a variance, customers may submit a letter requesting the variance to the Utilities Director. The letter must include an
explanation of why the requirements in Table 1 are not appropriate, cause extreme hardship, or affect health and safety. The letter should include proposed water use reductions for each stage and an explanation of why they are more appropriate.

A decision to approve or deny variance requests will be based upon consideration of criteria including, but not limited to: impact on water demand, expected duration of water shortage, alternative source options, social and economic importance of water use, purpose of water use (i.e., necessary use of drinking water) and the prevention of structural damage.

IX. Expected Effectiveness

The effectiveness of the Cary’s Water Shortage Response Plan will be determined by measuring system-wide water use reduction. Variables other than water use restrictions that may impact reduction goals will be considered. Some of these include frequency of plan activation, any problem periods without activation, total number of violation citations, desired reductions attained and evaluation of demand reductions compared to historical data. Table 4 indicates the potential expected reduction from usage levels that were documented using historic customer billing records.

X. Revision

The WSRP will be reviewed if there are new circumstances affecting water supply and demand, and following any Water Shortage declaration. The WSRP will be updated if indicated after a review, or at a minimum every five years as required by the provisions of GS 143-355 (l). The Utilities Director (or designee) is responsible for initiating all WSRP updates.

XI. Public Comment

The 2009 WSRP was prepared based on public input received via an online survey (available for one month; 91 participants), emailed comments, and at an Open House held April 29, 2009. Town Manager or designee may review and approve further updates to the Water Shortage Response Plan.
